

PMK Pyro Film Development Chart

Caution: PMK Pyro is POISONOUS and is absorbed by bare skin! Handle with extreme care! Avoid inhaling fumes! Always wear protective clothing, including eye goggles and non-porous gloves! Read THE BOOK OF PYRO by Gordon Hutchings, before using this product. For products contact <u>Eight Elm Photo.</u>

PMK Pyro Developer = 1 part A + 2 parts B + 100 parts Water

Presoak Film > Developer > Stop Bath > Fixer > Used Developer > Wash

1) Presoak - 2 to 4 minutes. Dry films placed in PMK Pyro will immediately stick together.

2) Developer - Agitate every <u>15 seconds</u> during development. Inadequate agitation may result in streaked negatives. Tray processing is NOT recommended. Tanks ensure consistent results.

- 3) Stop bath Diluted to at least ¼ normal strength. 4 minutes in plain water is ok for normal or plus times.
- 4) Fix 10 minutes using only a non-hardening fixer.
- 5) Used Developer Agitate every 30 seconds for 2 4 minutes after fix to induce stain.
- 6) Wash Film 30 to 45 minutes (stain intensifies during the wash).

The Stained Negative:

PMK Pyro is a fine grain pyrogallol developer with which extremely sharp negatives with beautiful highlight detail may be created. The yellowish stain it produces, when combined with the bluish light from a cold lamp enlarger permits the 0 filter to darken highlight areas without affecting shadows.

The 5 filter will darken shadow areas without affecting highlights.

I have obtained excellent results with Agfa's APX 100, 120 film. Some newer emulsions do not stain as well as Agfa 100, although Ilford SFX 200 appears to be an exception. Some older films such as Kodak's 35mm Tech Pan do not stain well. There also appears to be a difference between 35mm, 120 and 4x5 sheets of the same film.

The following developing times are not absolute, and are given for normal development at 70°F. For each degree of increased temperature, reduce developing time by 4%.

PMK PYRO Film Development Chart

| FILM & LINKS | RATING | <u>MINUTES</u> | <u>STAIN</u> |
|-------------------------|---------|----------------|------------------------|
| <u>Agfa</u> | | | |
| APX 25 | 16 | 11 | Poor |

Minus-X Development (as per Gordon Hutchings)

To photograph a dark scene that includes a window in full sunlight with up to \pm 20 stops of contrast;

- **1)** Meter and place only the low values, adding 3 stops to the exposure.
- **2)** Reduce the normal film developing time by 50%
